Flex-Vent IHS Series In-Line Electric Powered Duct Heater

The **Flex-Vent** line-up of in-line electric heaters will provide warmth to your jobsite or any other confined work area. We provide a wide variety of kW ranges to fit your application. Our portable in-line heater systems can be equipped with an internal blower or used with an auxiliary blower & ducting to create a temperature suitable for working in colder climates or conditions.

The **Flex-Vent IHS Series In-Line Electric Powered Duct Heater** offers a range from 10 kW up to 150 kW. The units can be wired for 120, 230 or 460 volt, single or three phase, 60 Hertz power. The controls are mounted in a NEMA 4 enclosure that energizes the multiple heating stages. The heating elements are on a floating rack suspension system which allows a higher flow of air with a minimal pressure drop. Airflow is required to pass through the heating element duct box, prior to being energized, then the heated air can exit out the discharge. The **Flex-Vent IHS Series** comes standard with QF connections on the inlet and outlet duct box for quick release ducting, hoses or accessories. This portable in-line heater system is skid mounted and can be easily maneuvered or lifted into any jobsite. Installation hook-up is simple.

Contact one of our Sales Associates for more information on the **Flex-Vent IHS Series** portable in-line electric powered duct heater systems.

Simple Solutions. Quality Craftsmanship. Proven Reliability.
